AI Readiness Review

Modern AI can assist with many tasks that modern-day businesses engage in. AI-based tooling can perform analytical or development tasks that would require the time and attention of trained professionals and complete it in a fraction of the time a person might take. There are risks, however, that data could be shared improperly, outputs from AI could be inaccurate, or the technology itself may be unstable. This creates a tough decision for many organizations: to embrace AI or not.

K logix recognizes that the decision to invest in AI tooling is not easy, and it is made more challenging with the lack of vetted, thoughtful advice to consider. K logix, which has a consulting and research team experienced in helping global businesses tackle tough cyber security questions, has developed a multi-step approach to help guide organizations through these confusing times.

Our consulting team can help you understand if your organization is ready for AI by exploring the following benchmarks:

Organizational Preparations:	These are the benchmarks K logix recommends all organizations meet before investing heavily in organization-supported AI.
Operating Principles:	These are the policies and processes that should be used to guide decision-making with respect to an organization-supported AI.
Investment Considerations:	These are points organizations should consider when they are evaluating specific AI solutions.

THIS AI READINESS ASSESSMENT WILL HELP YOU:

- Identify and establish key program before investing in AI tools
- Determine themes around data security that should resonate with any AI project
- Recognize key "look-fors" in any AI tool to ensure it meets your needs
- Receive recommendations written in business language to ensure everyone from the boardroom to the server room understands how your organization plans to embrace these new technologies
